

Here are some more problems about properness:

**Problem 1.(a)** Let  $k$  be an algebraically closed field and let  $X$  be a connected, reduced, proper scheme over  $k$ . Show that  $\mathcal{O}(X) = k$ . (Hint: Identify  $\mathcal{O}(X)$  with  $\text{Hom}(X, \mathbb{A}_k^1)$ , then embed  $\mathbb{A}_k^1$  into  $\mathbb{P}_k^1$ .

(b) Let  $X$  be as above and let  $U$  be an affine  $k$ -scheme of finite type. Show that all maps from  $X$  to  $U$  are constant.

(c) Suppose that we remove the hypothesis that  $k$  is algebraically closed (but  $X$  is still a connected, reduced, proper scheme over  $k$ ). Show that  $\dim_k \mathcal{O}(X) < \infty$ .

**Problem 2** In this problem, we will prove the rigidity lemma. Let  $k$  be an algebraically closed field (there are versions without algebraic closure, but I'm trying to keep this simple). Let  $X$ ,  $B$  and  $Z$  be reduced  $k$ -schemes of finite type over  $k$ . Suppose that  $X$  is connected, proper over  $k$ , and nonempty; that  $Z$  is separated and  $B$  is connected. Let  $\phi : B \times X \rightarrow Z$  be a morphism of  $k$ -schemes. Let  $b$  be a point of  $B$  with fraction field  $k$ , let  $z$  be a point of  $Z$  and suppose that  $\phi : X \times \{b\} \rightarrow Z$  is the constant map to  $z$ . We will show that, for every  $b' \in B$ , the map  $\phi : X \times \{b'\} \rightarrow Z$  is a constant map.

(a) Let  $U$  be an affine open neighborhood of  $z$  in  $Z$ . Show that there is an open neighborhood  $C$  of  $b \in B$  such that  $\phi(X \times C) \subseteq U$ .

(b) Show that, for every  $b' \in C$ , the map  $\phi : X \times \{b'\} \rightarrow U$  is constant. (Hint: Think about problem 1.)

(c) Choose a point  $x_0 \in X$  with fraction field  $k$  and let  $\iota$  be the inclusion of  $x_0$  into  $X$ . Let  $\pi_2$  be the projection  $X \times B \rightarrow B$  and define  $\psi : X \times B \rightarrow \phi$  to be  $\phi \circ (\iota \times \pi_2)$ . (In other words, on the level of closed points,  $\psi(x, b) = \phi(x_0, b)$ .) Show that  $\phi = \psi$  everywhere on  $B$ . (Hint:  $B$  is connected.)

**Problem 3** Here is a fun application of the rigidity lemma: Let  $G$  be a connected, proper algebraic group over a field  $k$ . Show that  $G$  is abelian. (Hint: Think about the map  $G \times G \rightarrow G$  given by  $(g_1, g_2) \mapsto g_1 g_2 g_1^{-1} g_2^{-1}$ .)
